

## Python 3

For this bootcamp we'll be using a few data visualization modules to plot data using Python.

In this notebook we will:

1. Import required modules and datasets
2. Manipulate the data using Pandas
3. Visualize the data

```
In [167]: ▶ #Remove warnings from our outputs
import warnings
warnings.filterwarnings("ignore")
```

## Matplotlib

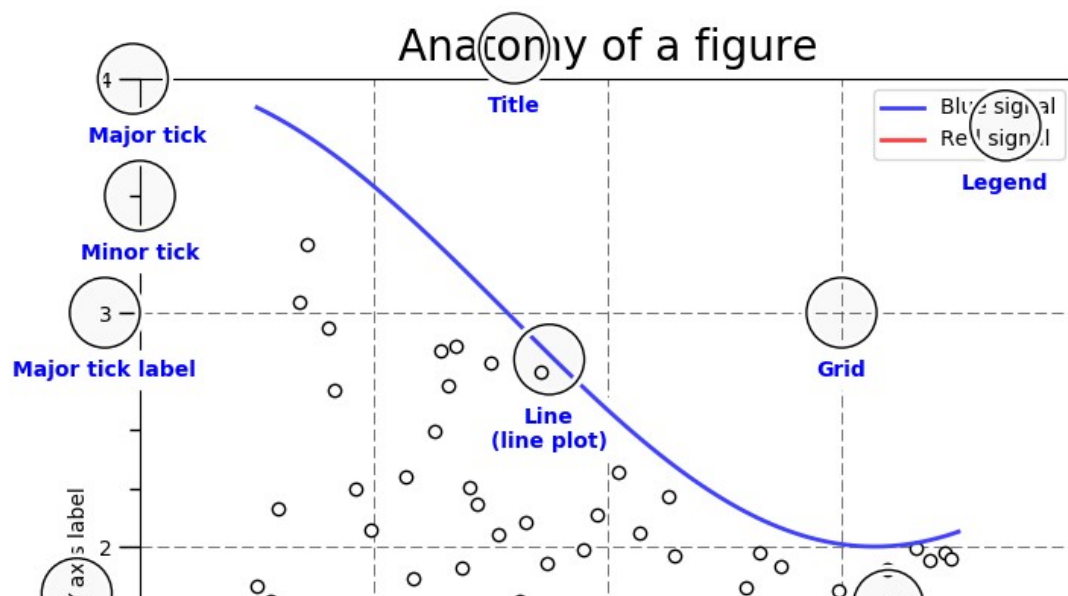

"Matplotlib is a comprehensive library for creating static, animated, and interactive visualizations in Python."

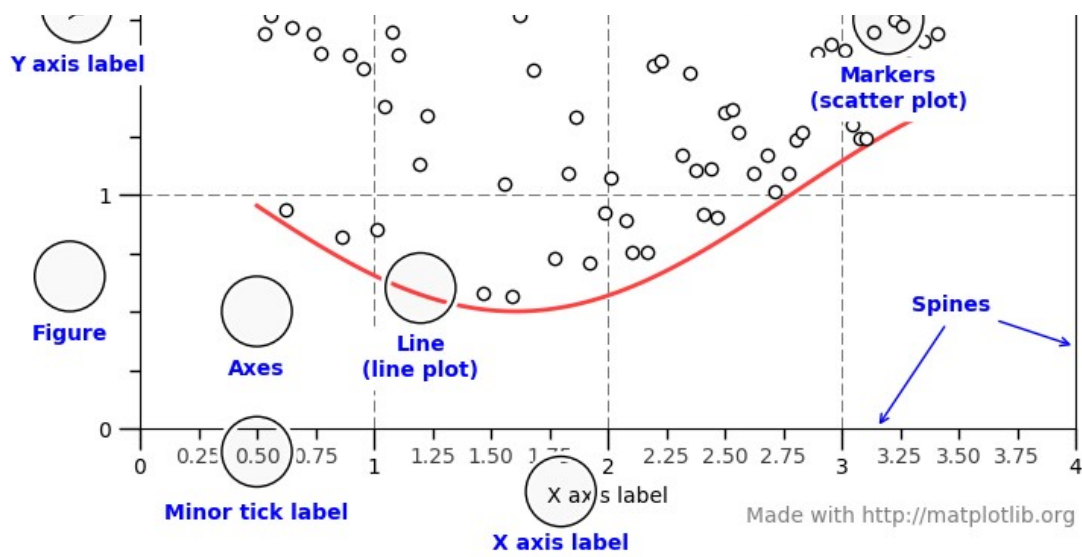

Matplotlib is one of the most popular libraries used to create data visualizations in Python. It uses an object-oriented API (classes) which we've already worked with when using Pandas

Below is a breakdown of some of the key elements that go into a matplotlib figure

Two main concepts to understand

- A figure is the whole figure and can contain any number of axes (usually at least 1)
- Axes are the "plot" that will contain your title, legend, etc.

```
In [168]: ▶ import matplotlib.pyplot as plt
import numpy as np

x = [1,2,3,4,5,6]

data = np.array(x)

# https://matplotlib.org/tutorials/introductory/usage.html#sphx-glr-tu
# Create a figure and an axes.
fig, ax = plt.subplots()

# Plot some data on the axes.
ax.plot(data, data, label='linear')

# Plot more data on the axes...
ax.plot(data, data**2, label='quadratic')

# ... and some more.
ax.plot(data, data**3, label='cubic')

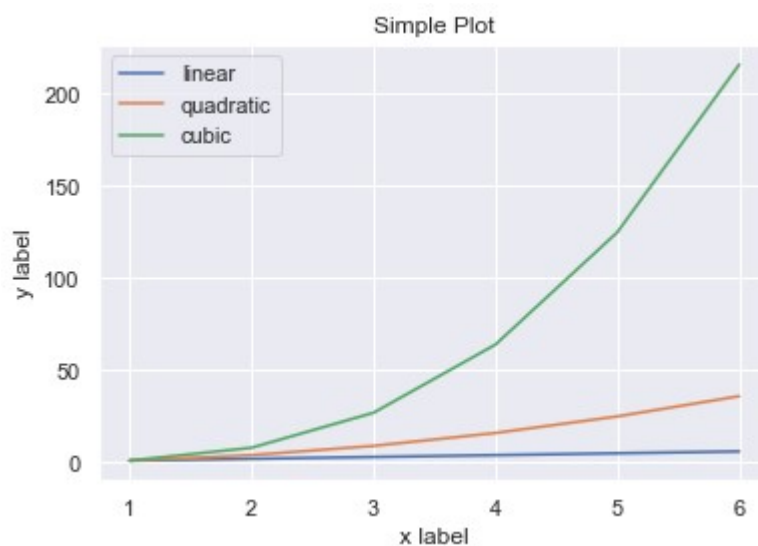

# Add an x-label to the axes.
ax.set_xlabel('x label')

# Add a y-label to the axes.
ax.set_ylabel('y label')

# Add a title to the axes.
ax.set_title("Simple Plot")

# Add a legend.
ax.legend()

# Save our plot as an image
plt.savefig('line_plot.png')
```

## Pandas Plotting

Pandas offers a easy way to access Matplotlib to plot the data inside of a DataFrame.

We will go over a few ways to plot some stock data

```
In [169]: ▶ #Import Pandas
import pandas as pd

#A few configurations
pd.plotting.register_matplotlib_converters()
%matplotlib inline

print("Setup Complete")

Setup Complete
```

```
In [170]: ▶ # Import stock data
stock_df = pd.read_csv('data/stocks.csv', index_col="date", parse_date
```

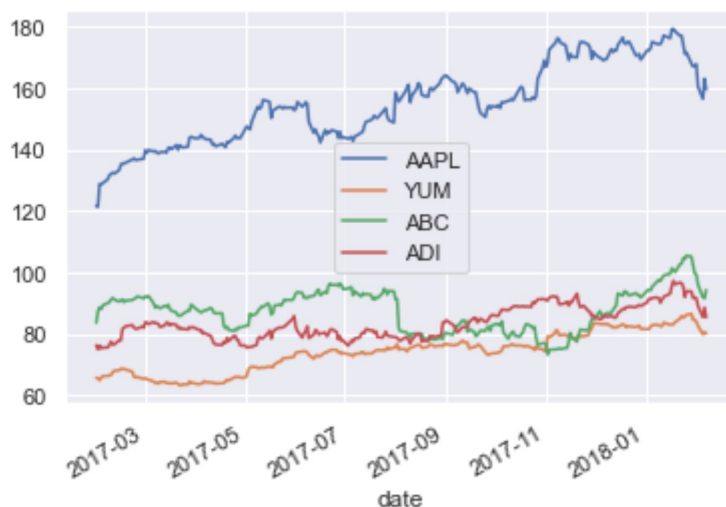

```
In [171]: ▶ #Take a look at the data
stock_df.head()
```

Out[171]:

	AAPL	YUM	ABC	ADI
date				
2017-01-30	121.63	65.68	83.62	76.28
2017-01-31	121.35	65.53	87.28	74.94
2017-02-01	128.75	64.87	88.61	76.17
2017-02-02	128.53	65.67	88.05	75.23
2017-02-03	129.08	66.23	89.28	75.52

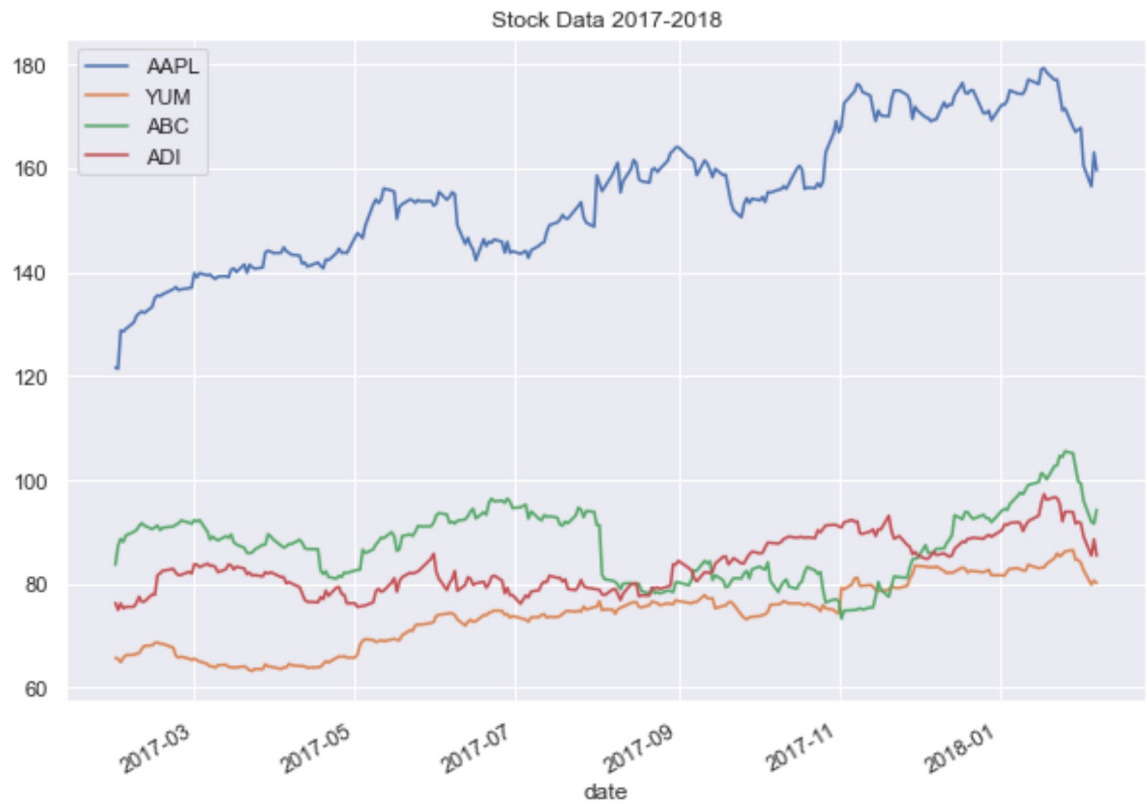

```
In [172]: ▶ #Plotting data as easy as calling the plot() function
stock_df.plot(kind='line')
```

Out[172]: <matplotlib.axes.\_subplots.AxesSubplot at 0x17d5b903a20>

```
In [173]: #Plotting data as easy as calling the plot() function  
stock_df.plot(kind='line', figsize=(10,7), title='Stock Data 2017-2018')
```

```
Out[173]: <matplotlib.axes._subplots.AxesSubplot at 0x17d5bf399e8>
```

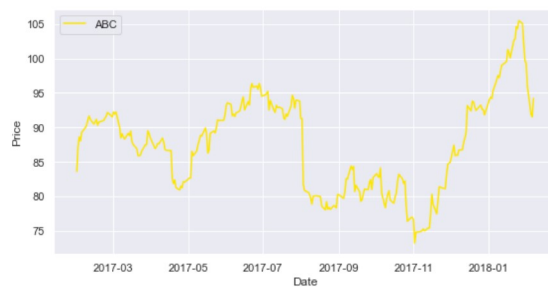

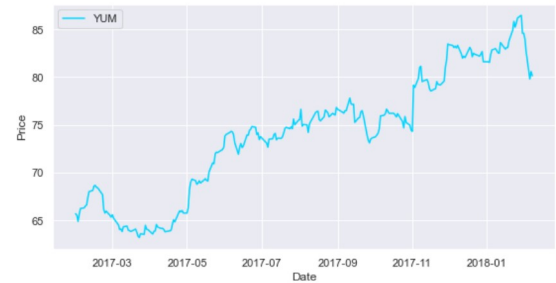

```
In [174]: ▶ #Define a MPL figure and axes to give us more control of our visual
fig, axs = plt.subplots(2, 2, figsize = (20,10))
fig.suptitle('Vertically stacked subplots', fontsize=20)

#Must specify the axes we want to plot onto, and can specify addicitor
stock_df.plot(kind='line', subplots=True, colormap='jet', ax = axs)

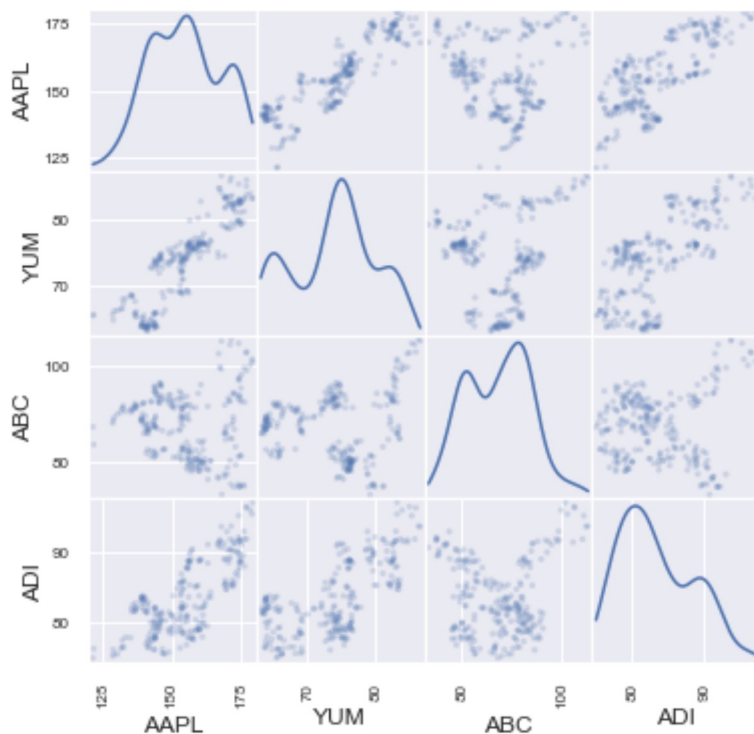

#Use a FOR loop to add on the X and Y labels
for ax in axs.flat:
    ax.set(xlabel='Date', ylabel='Price')
```

Vertically stacked subplots

```
In [175]: ▶ from pandas.plotting import scatter_matrix

scatter_matrix(stock_df, alpha=0.2, figsize=(6, 6), diagonal='kde')
plt.show()
```

## Barchart

For the next portion of the bootcamp, we're going to be using Airbnb data.

We'll be going over some of the other kinds of plots we can create directly from a Pandas DataFrame

```
In [176]: ▶ #https://www.kaggle.com/shivamb/netflix-shows
#Import new dataset from the data/netflix_titles.csv file into variable
net_df = pd.read_csv('data/netflix_titles.csv')
```

```
In [177]: ▶ net_df.shape
```

```
Out[177]: (5243, 12)
```

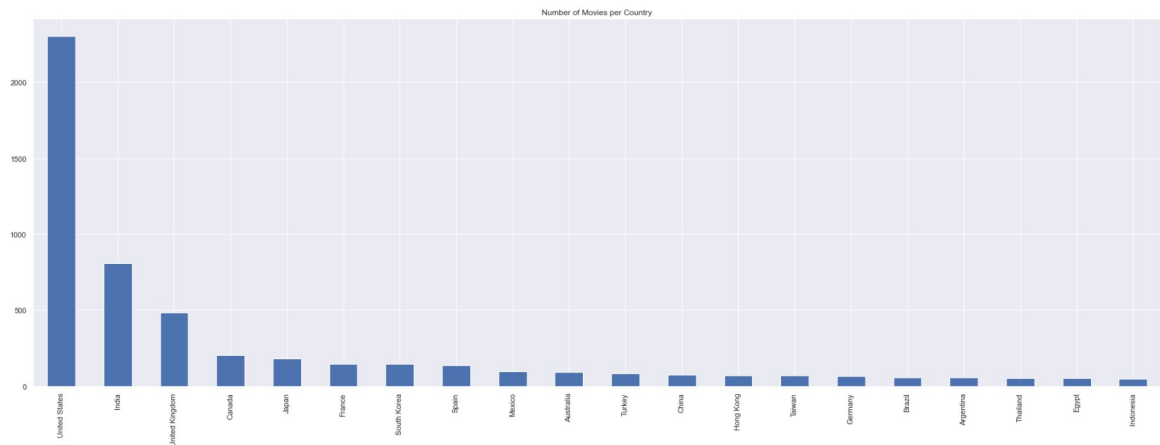

```
In [178]: ▶
```

```
In [179]: ▶ #Calculate the number of movies per country
freq = net_df['country'].value_counts()
```

```
In [180]: ▶ #Plot this data as a bar chart
plt.figure(figsize=(30,10))

freq.plot(kind='bar', title='Number of Movies per Country')
```

Out[180]: <matplotlib.axes.\_subplots.AxesSubplot at 0x17d37ed9320>

```
In [181]: ▶ #Create a pivot so we can visualize the data
net_pivot = net_df.pivot_table(values='show_id', index="country",
                                columns = 'type', aggfunc='count')
```

In [182]: ▶

In [183]: ▶

In [184]: ▶

```
In [185]: ▶ net_pivot.head()
```

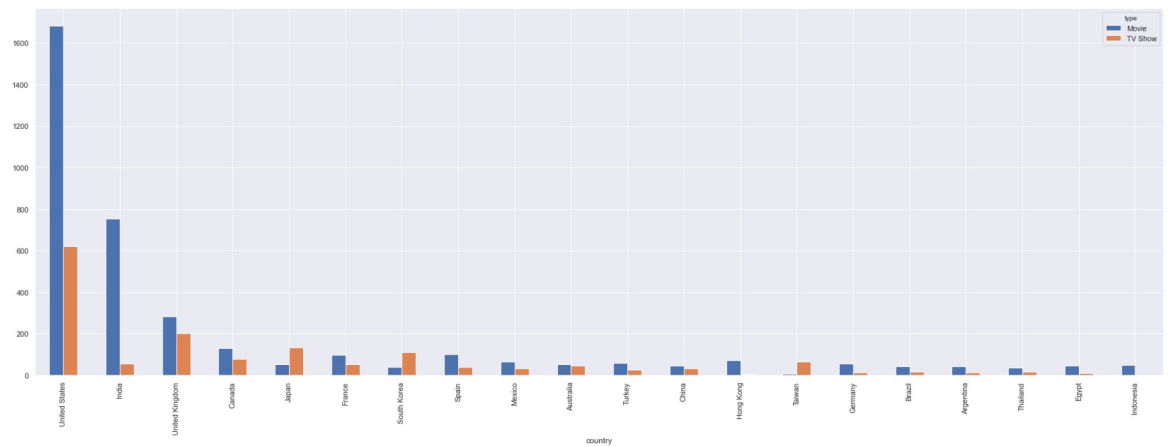

Out[185]:

	type	Movie	TV Show
country			
United States		1682	620
India		753	55
United Kingdom		282	201
Canada		130	76
Japan		52	132

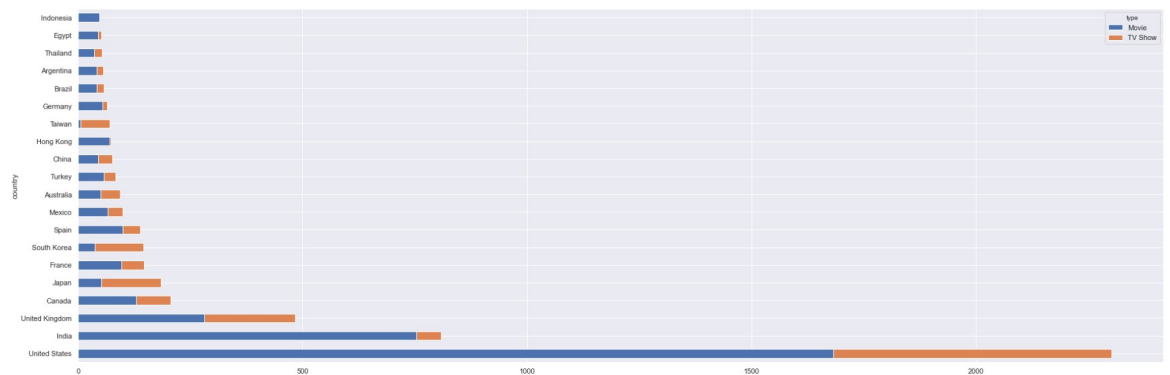

```
In [186]: #Create a basic bar chart of the pivot table
net_pivot.plot(kind='bar', figsize=(30,10))
```

```
Out[186]: <matplotlib.axes._subplots.AxesSubplot at 0x17d5e0b5550>
```

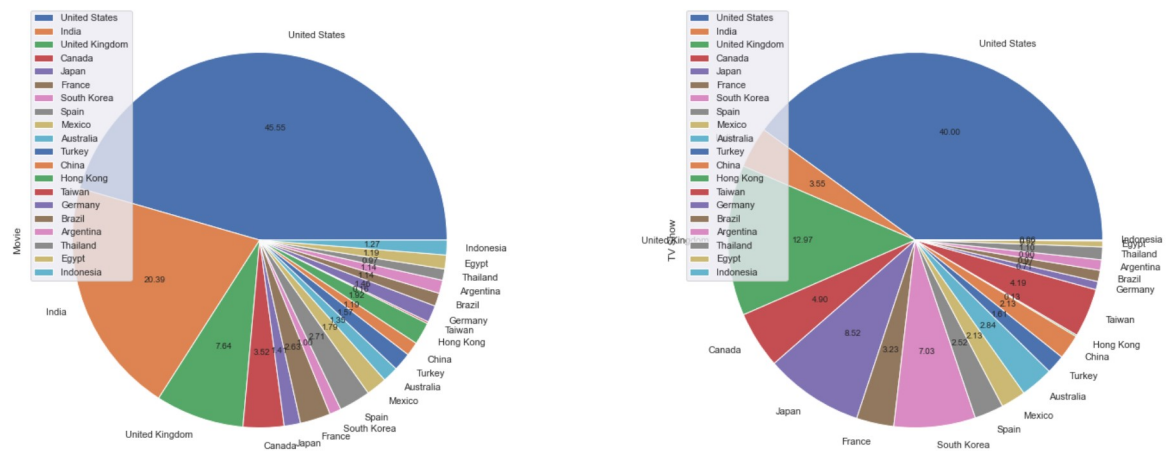

```
In [187]: #We can stack the bar chart and change the orientation to horizontal
net_pivot.plot(kind='barh', figsize=(30,10), stacked=True)
```

```
Out[187]: <matplotlib.axes._subplots.AxesSubplot at 0x17d5e0a51d0>
```

```
In [188]: #Pie charts and configurations
net_pivot.plot(kind='pie', subplots=True, figsize=(25, 10), autopct='%1.1f%%',
plt.show())
```

# Seaborn

Seaborn is a Python data visualization library based on matplotlib.

It provides a high-level interface for drawing attractive and informative statistical graphics.

```
In [189]: ► import seaborn as sns

           #Load tip data and
           tips = sns.load_dataset("tips")
```

```
In [190]: ► tips.head()
```

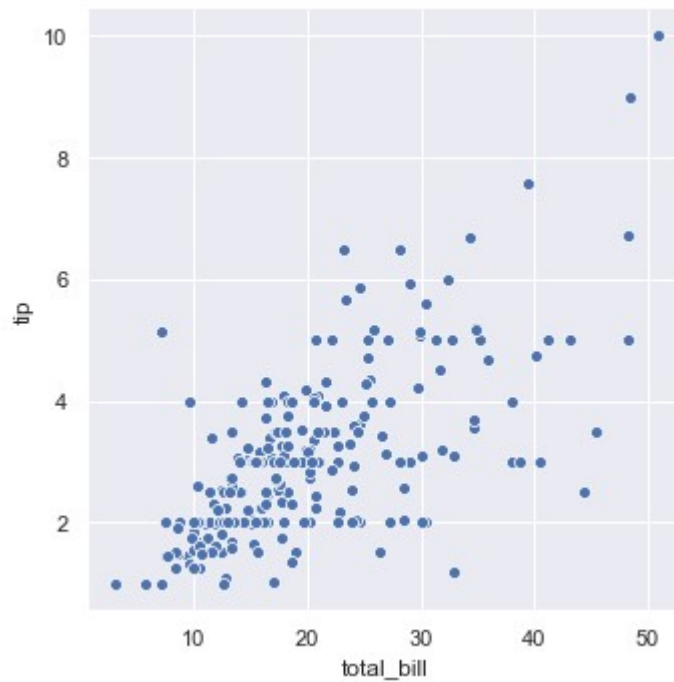

Out[190]:

	total_bill	tip	sex	smoker	day	time	size
0	16.99	1.01	Female	No	Sun	Dinner	2
1	10.34	1.66	Male	No	Sun	Dinner	3
2	21.01	3.50	Male	No	Sun	Dinner	3
3	23.68	3.31	Male	No	Sun	Dinner	2
4	24.59	3.61	Female	No	Sun	Dinner	4

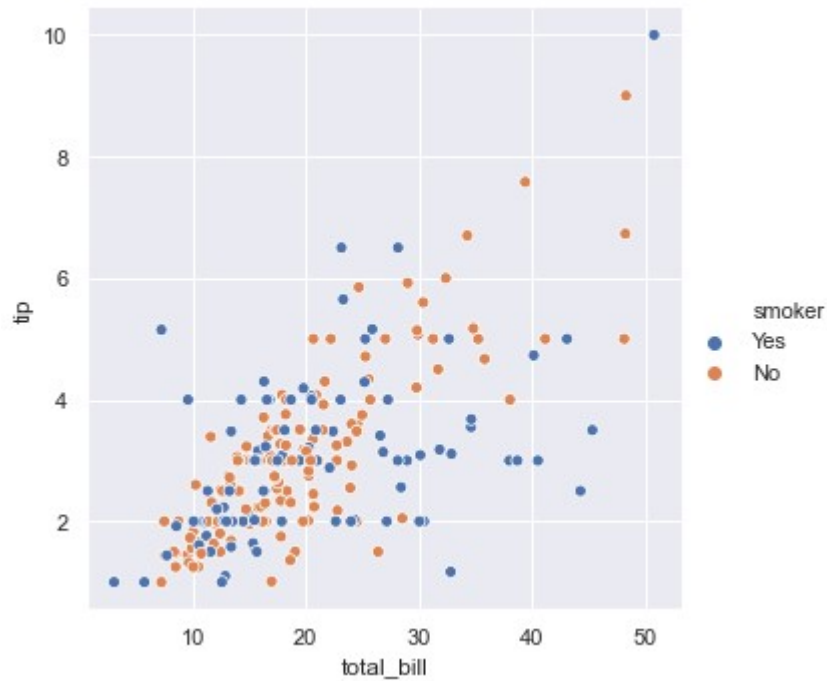

```
In [191]: #Assign a style  
sns.set(style="darkgrid")  
  
# Set the width and height of the figure  
plt.figure(figsize=(16,6))  
  
sns.relplot(x='total_bill', y='tip', data=tips)
```

Out[191]: <seaborn.axisgrid.FacetGrid at 0x17d378cdb00>

<Figure size 1152x432 with 0 Axes>

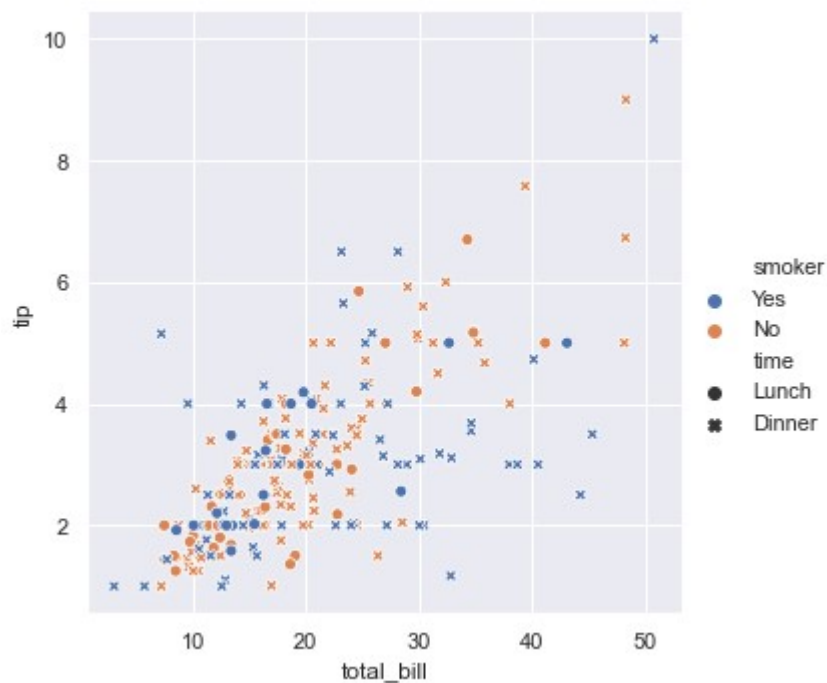

```
In [192]: ▶ # We can add a third dimension with color and style
sns.relplot(x="total_bill", y="tip", hue="smoker", data=tips);
```

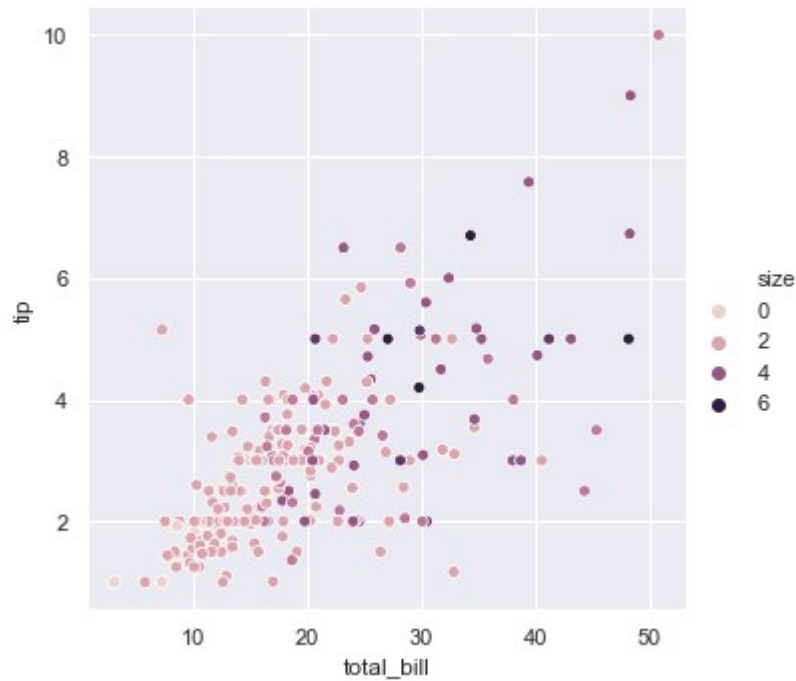

```
In [193]: ▶ #Add a fourth dimension using different variables for hue and style
sns.relplot(x="total_bill", y="tip", hue="smoker", style="time", data=
```

```
Out[193]: <seaborn.axisgrid.FacetGrid at 0x17d5f7dc588>
```

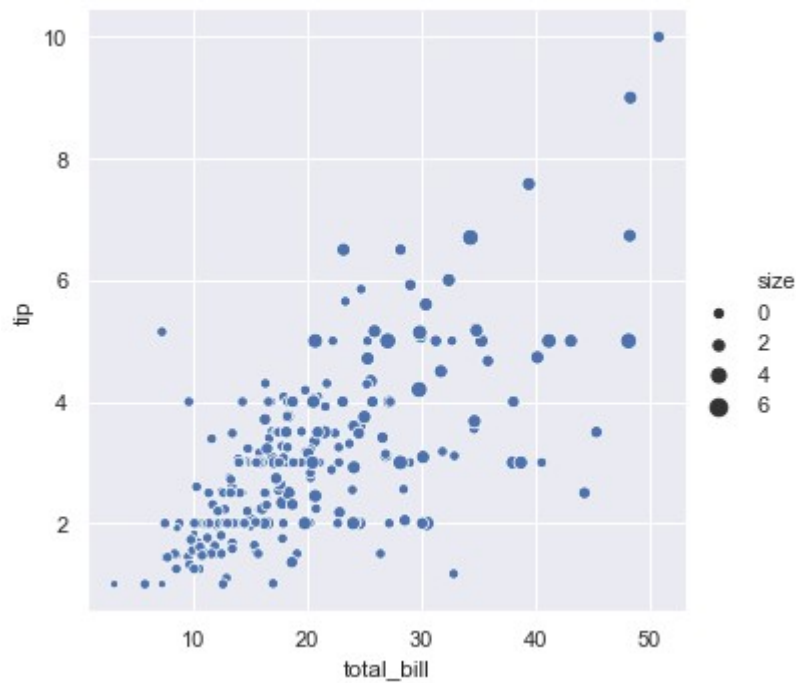

```
In [194]: ▶ #Replot using size variable for hue
sns.relplot(x="total_bill", y="tip", hue="size", data=tips)
```

```
Out[194]: <seaborn.axisgrid.FacetGrid at 0x17d5f839f28>
```

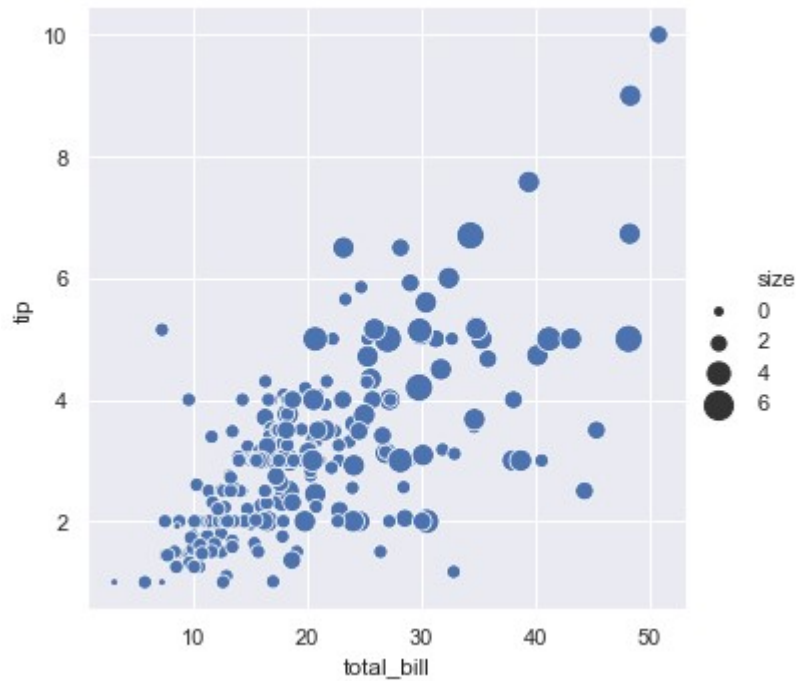

```
In [195]: ▶ #The size parameter allows us to change the size of data points using
sns.relplot(x="total_bill", y="tip", size="size", data=tips);
```

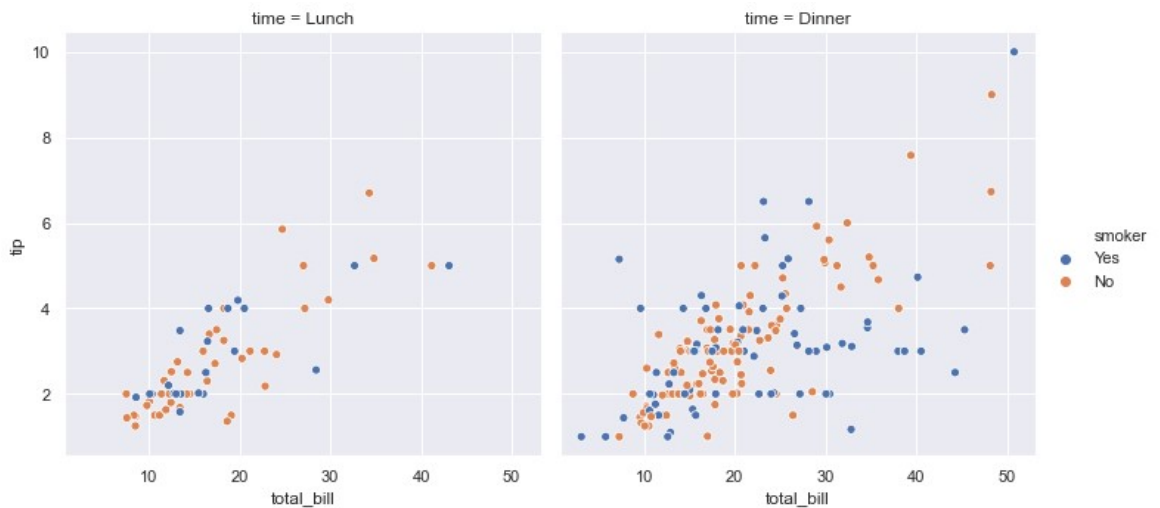

```
In [196]: ▶ #The size parameter determines the scale of the data points
sns.relplot(x="total_bill", y="tip", size="size", sizes=(15, 200), data=ti
```

```
Out[196]: <seaborn.axisgrid.FacetGrid at 0x17d5f895160>
```

```
In [197]: ▶ #The col parameter creates subplots along the provided variable
sns.relplot(x="total_bill", y="tip", hue="smoker", col="time", data=ti
```

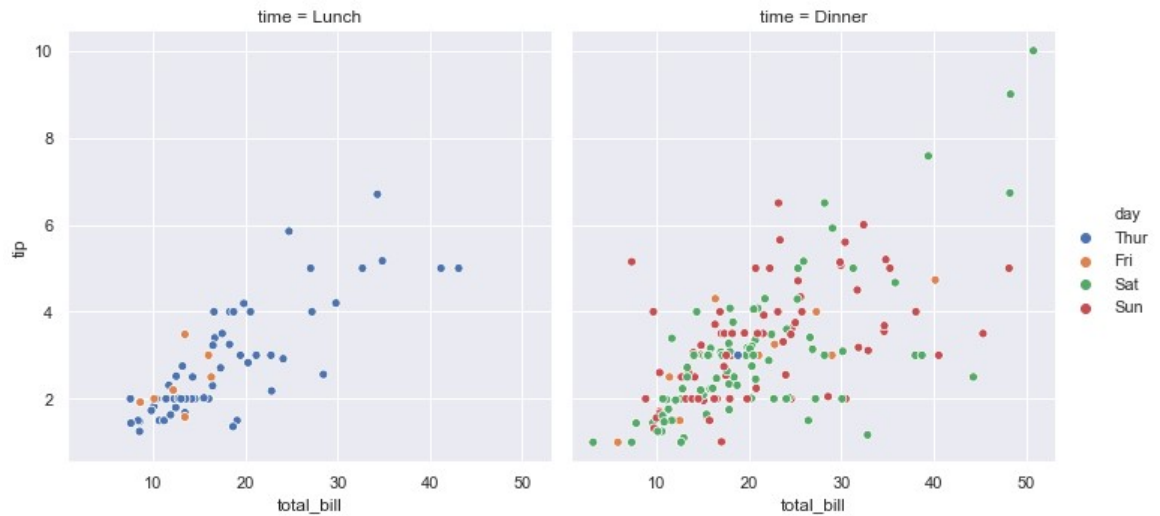

```
Out[197]: <seaborn.axisgrid.FacetGrid at 0x17d61d011d0>
```

```
In [198]: ▶ #Try plotting the Day of the week to see if it has an effect on the t
sns.relplot(x="total_bill", y="tip", hue="day", col="time", data=tips)

#Derive one insight from the graph
#A:
```

Out[198]: <seaborn.axisgrid.FacetGrid at 0x17d61cdb940>

```
In [199]: ▶
```

Out[199]:

	AAPL	ABC
date		
2017-01-30	121.63	83.62
